Java Parallel Streams Internals: Order of Results (Part 1)

Douglas C. Schmidt

<u>d.schmidt@vanderbilt.edu</u>

www.dre.vanderbilt.edu/~schmidt

Professor of Computer Science

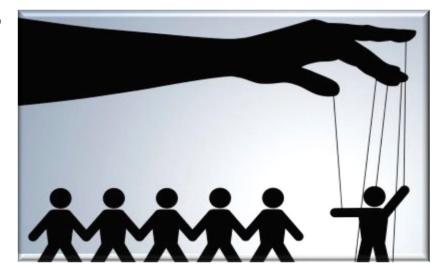

Institute for Software Integrated Systems

Vanderbilt University Nashville, Tennessee, USA

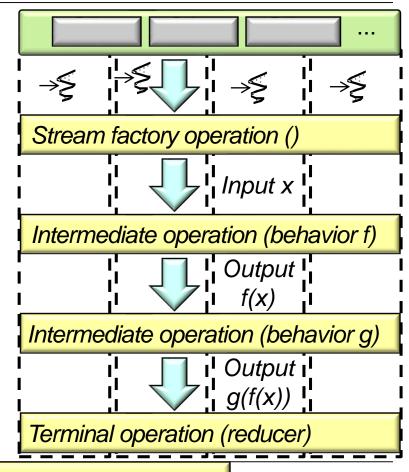

Learning Objectives in this Part of the Lesson

- Understand parallel stream internals, e.g.
 - Know what can change & what can't
 - Splitting, combining, & pooling mechanisms
 - Order of processing
 - Order of results
 - Overview

• The processing *results* in a parallel stream are more deterministic than ordering

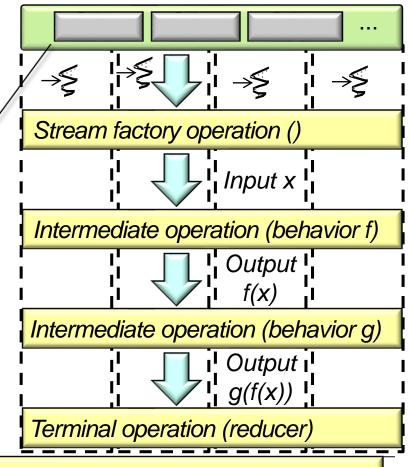

See en.wikipedia.org/wiki/Deterministic_algorithm

- The processing results in a parallel stream are more deterministic than ordering
 - Programmers can control if results are presented in "encounter order" (EO)

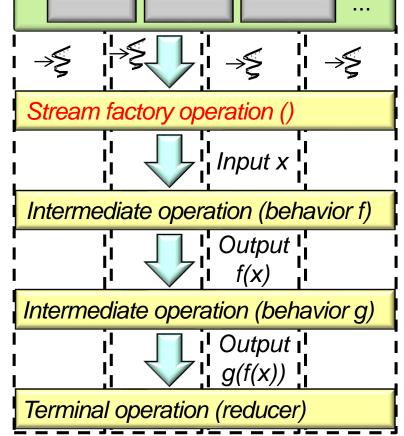

EO is the order in which the stream source makes its elements available

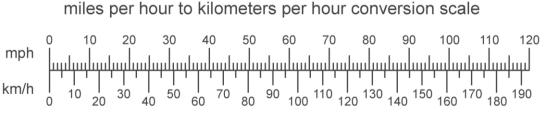

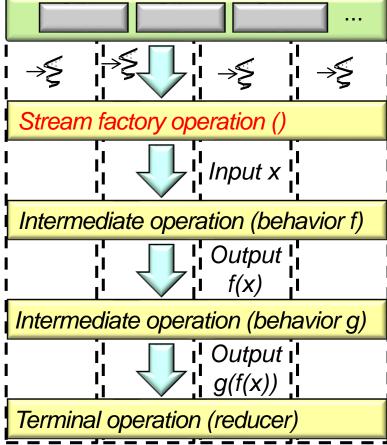

See www.logicbig.com/tutorials/core-java-tutorial/java-util-stream/ordering

- The processing *results* in a parallel stream are more deterministic than ordering
 - Programmers can control if results are presented in "encounter order" (EO)
 - EO is maintained if source is ordered & the aggregate operations used are obliged to maintain order

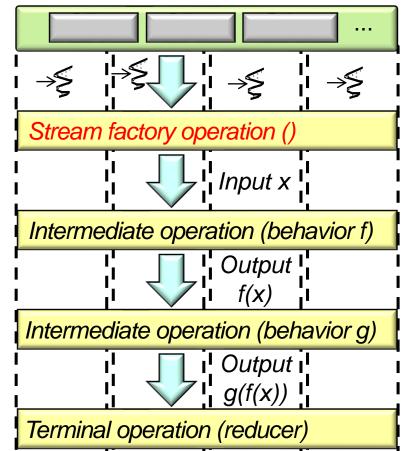

- The processing results in a parallel stream are more deterministic than ordering
 - Programmers can control if results are presented in "encounter order" (EO)
 - EO is maintained if source is ordered
 & the aggregate operations used are
 obliged to maintain order
 - The semantics are the same whether the stream is parallel or sequential

- The processing *results* in a parallel stream are more deterministic than ordering
 - Programmers can control if results are presented in "encounter order" (EO)
 - EO is maintained if source is ordered
 & the aggregate operations used are
 obliged to maintain order
 - The semantics are the same whether the stream is parallel or sequential
 - Performance may differ, however
